

Water as a Resonant Medium for Unusual External Environmental Factors.

James DeMeo, PhD Orgone Biophysical Research Lab, Ashland, Oregon

One of the significant proofs for a new scientific finding is the independent discovery and/or verification of it by other researchers. During the last Century, there were multiple lines of converging evidence, suggesting the existence of a dynamic plasmatic energy existing within living organisms and water, existing as a background medium filling the atmosphere, and found within the deep vacuum of space itself. The biologist Frank Brown, investigating the external biological clock mechanism, observed an unshieldable cosmic *solar-lunar* phenomena capable of affecting the behavior and metabolism of many living creatures. “Tidal” forces could be transmitted through laboratory walls into controlled aquaria, for one example, where isolated creatures followed the rhythms of the lunar tide, which they could not react to via known measures. Physicians such as Harold Burr and Bjorn Nordenstrom argued for a specific *electro-dynamic* energy in the body, which they measured independently via bioelectricity and other measures, showing its similarities to the *acupuncture energy* of Chinese medicine. Such experiments typically utilized water as a *carrier* for the charge of this previously unknown energy phenomenon. Intuitive naturalist Viktor Schauberger argued for a specific quality of alive or *living water*, and made practical applications of this in forestry. Biologist Jacque Benveniste investigated and proved the *memory of water* effect, as employed by homeopathic medicine. Wilhelm Reich’s experiments indicated a specific life-energy, *the orgone*, which was reflectable by metals and more active at higher altitudes, able to charge up water, and possessed of cosmic, biological and meteorological functions. Biochemist Giorgio Piccardi also discovered a similar *biocosmic, physico-chemical fluctuating phenomenon* at work in physical chemistry, reflectable by metal plate, more active at higher altitudes, and possessing significant solar-terrestrial, biological and meteorological components. His findings showed fluctuations in the freezing of super-cooled water, tied to sunspot variations. Much of this same work integrates with diverse astrophysical theory which today argues for an *interstellar medium*, variously termed *cosmic plasma*, *dark matter*, or even *cosmic ether*. Physicist Dayton Miller confirmed a *dynamic cosmic ether*, moving faster at higher altitudes, and slowed or reflected by dense materials such as metals or stone. His work has been confirmed “down to the details” by radiophysicist Yuri Galaev, and others. All of these natural scientists undertook decades of careful experimental work, indicating the presence of a very similar water-affecting cosmic medium. They mostly did not know of each other’s existence. All were maligned and assaulted by the dogmatic orthodoxy of science. I have been privileged to replicate some of these experiments, notably using the

highly unorthodox *orgone accumulator* of Reich to affect an approximate 40% increase in sprouting seeds as compared to controls. Another of Reich's apparatus was evaluated for its ability to influence clouds from a distance, with basic confirmation. The effect appears water-moderated in most cases. Taken together these studies are suggestive of a major scientific breakthrough, ignored or dismissed prematurely during the 20th Century.
