Abstract

My field of interest is focused on nature in general and especially on the processes which can be observed when water is analyzed by using a dark field microscope.

The water drop is placed on the microscope slide, the water evaporates with time and residues remain. By using the microscope, crystallization images can be observed. Depending on the geological origin of the water samples the images differ in shape as well as color. I analyzed samples of tap water, spring water, mountain spring water and dew drops and the results are presented at the conference.

My intention is to explore water from a different point of view.
